1. GENERAL DESCRIPTION

The Halar® Coated Concentrate Control Valve (CCV) is used with Viking foam systems as a positive shut-off valve for the foam concentrate. The CCV valve opens automatically when there is water flow in the system riser. Once open, the foam concentrate will enter the proportioning device creating foam water solution..

A. Standard Foam Deluge and Foam Preaction Systems (See Figure 4)

The CCV valve is a straight through Halar[®] coated deluge. The priming connection can be part of the riser control valve trim, conventional deluge. When the priming connection to the CCV is located on the primary riser valve trim, the priming supply connection to the CCV is located prior to the release trim. The actual supply inlet to the CCV should be connected to an open connection port on the cover of the deluge valve. The 1/2" pipe plugs installed in the cover of the deluge valve may be removed and piping from the valve cover can be connected to the priming chamber of the CCV or an outlet can be created prior to the release device (solenoid or pneumatic actuator) on the valve trim. When the deluge I valve activates, the priming water in the deluge valve and the CCV are released simultaneously allowing both valves to open. Priming water pressure will be drained through the deluge I valve trim. The valves will remain open until the system is reset. Refer to design data pages for re-setting instructions.

B. Wet Foam Systems (See Figure 3)

The CCV valve is a straight through Halar[®] coated deluge. Where the CCV is used in conjunction with a wet foam system a separate primary priming connection is required. The separate priming connection will consist of a ½" ball valve, ½" "Y" strainer, 1/8" restricted orifice, ½" spring loaded check valve, and Pressure Operated Relief Valve (PORV). The priming water supply to the CCV is taken upstream of the riser control valve. The priming supply feeds through the system to the priming chamber of the CCV. The sensing side of the PORV is connected to the alarm connection of the Alarm Valve. When water flow is present through the sprinkler riser, water flows from the alarm connection to the sensing side of the PORV opens which drains the CCV priming chamber allowing it to open. Foam concentrate will discharge from the CCV to the proportioning device until water pressure is removed from the sensing side of the PORV. Note that the PORV ½" drain will operate when the system is activated. The PORV must be piped to an open drain.

C. Pressure Regulating Flow Control Foam Systems – Electric release (See Figure 5)

Pressure regulating foam systems, either flow control or deluge, are used when there is a desire to control the discharge flow rate or discharge pressure in a foam system. When the remote shut-down capability of the system is desired, pressure regulating flow control trim is required. When pressure regulating trim is used, the Halar[®] Coated Concentrate Control Valve (CCV) cannot have a common priming supply as the riser flow control valve. The CCV priming connection will consist of a Pressure Operated Relief Valve (PORV), ½" ball valve, ½" "Y" strainer, 1/8" restricted orifice, and a ½" spring loaded check valve. The priming water supply to the CCV is taken upstream of the riser control valve. Priming water feeds through the priming connection to the priming chamber of the CCV. Actuation of the detection system will release the priming water pressure in the flow control valve's priming chamber allowing the flow control valve to open. While water flows through the flow control valve, water will flow out a ½" (15 mm) port on the discharge side of the flow control valve and pressurize the sensing end of the Pressure Operated Relief Valve (PORV), which will release the prime pressure of the Halar[®] Coated Concentrate Control Valve, allowing it to open and supply foam concentrate to the proportioning device. The CCV will remain open until water pressure is removed from the sensing side of the PORV. The PORV ½" drain must be piped to an open drain. When power is interrupted to the solenoid valve on the riser flow control valve, stopping the flow of water through the system. After water pressure to restore in the priming chamber, closing the CCV.

2. LISTINGS AND APPROVALS

UL Listed - Deluge Valve EX2006 FM Approved - FM5130, 1020 LPCB Refer to the individual technical data sheets for the components within the system.

4. INSTALLATION

Refer to specific technical data sheets, acceptable installation standards, codes and Authority Having Jurisdiction for additional installation, operation and maintenance instructions.

5. OPERATION

Refer to individual component technical data page.

6. INSPECTIONS, TESTS AND MAINTENANCE

NOTICE

The owner is responsible for maintaining the fire protection system and devices in proper operating condition. For minimum maintenance and inspection requirements, refer to recognized standards such as those produced by NFPA, LPC, and VdS which describe care and maintenance of sprinkler systems. In addition, the Authority Having Jurisdiction may have additional maintenance, testing and inspection requirements which must be followed.

A WARNING

Any system maintenance or testing that involves placing a control valve or detection system out of service may eliminate the fire protection of that system. Prior to proceeding, notify all Authorities Having Jurisdiction. Consideration should be given to employment of a fire patrol in the affected area.

It is imperative that the system is inspected and tested on a regular basis. The frequency of the inspections may vary due to contaminated or corrosive water supplies and corrosive atmospheres. In addition, the alarm devices or other connected equipment
